

ProcGen Context Studio

Official Configuration & User Guide

Welcome to the Omni-Agent Logic Controller. The Context Studio allows procurement managers, category leaders, and admins to define strict boundaries, financial guardrails, and behavioral rules for all ProcGen AI agents without writing a single line of backend code.

1. The 4-Stage Workflow

To ensure safe enterprise deployment of AI agents, the Context Studio enforces a 4-stage lifecycle:

- 1. Bootstrap:** Initialize a new configuration file (YAML format) targeted at a specific agent (e.g., Niti, Tark). Define the scope, rules, and logic.
- 2. Simulate:** Test your rules against historical mock-negotiations to see how the agent would react in a sandboxed environment.
- 3. Deploy:** Click the Deploy button. The active rule is instantly pushed to the global database and takes effect immediately on all live agent interactions.
- 4. Observe:** Monitor live agent transcripts to ensure they are strictly adhering to the YAML rules without hallucination or logic drift.

2. Configuration Parameters & Syntax

The studio uses a simple YAML structure. Below is the exact schema and allowed parameters you should use when defining agent logic.

definition: The high-level name of the strategy.

description: A human-readable explanation of what this logic file is meant to achieve.

scope: The boundaries of where this rule applies (e.g. `target_discount_percentage`).

rules: An array of exact natural-language commands the AI must obey.

3. Agent Targeting

When initializing a new context file, you must specify the Target Agent. The system currently supports:

Niti: Handles live Vendor Negotiations and pricing pushback.

Anveshan: Handles deep web sourcing, RFP generation, and supplier discovery.

Tark: Handles automated Purchase Order (PO) creation, approvals, and contract logic.

Garuda: Handles real-time risk, supply chain monitoring, and ESG compliance.

Jarvis: The global co-pilot for internal employees navigating the portal.

4. Best Practices for Successful Deployment

1. Keep rules mutually exclusive: Do not write conflicting rules. The AI may hallucinate trying to resolve the conflict.
2. Use precise metrics: Instead of writing "Try to get a good discount", write "Demand a 15% discount minimum."
3. Always click Deploy: Auto-save only saves your draft. The agent will not consume the new logic until you press Deploy.
